

Pow Mingle #11: JEV

A shared meal, a new technology, and something to try

About Pow Mingle

Our group is open to everyone interested in making interesting things, whether or not you work in tech.

AI tools and insights arrive every day. It can be hard to find time to understand them, let alone try them. Each month, we explore one new AI technology and apply it to our own ideas.

Bring your curiosity, an everyday frustration, or something you want to make. You do not need a technical background or a finished project.

Why meet at a restaurant?

Sharing a meal gives us a relaxed way to meet. Conversation can begin with what we do, what interests us, or what we are trying to figure out.

A restaurant makes room for people with different backgrounds to talk at the same table. We can ask basic questions, exchange unfinished ideas, and learn from one another over food.

The setting is part of the idea: make it easier to join the conversation, get to know someone, and find something worth trying together.

What to try tonight

1. Get to know the people at your table.
2. Explore JEV and the two examples.
3. Find one decision in your idea that AI could help with.

How JEV works

JEV is an AI model from TypeSafe. It understands text and answers focused questions with choices, probabilities, or scores that an app can use.¹

Ask a small question. Use the answer in your app.

Choose a folder	Choice
☒ Travel / Japan	☐ Work
Check a condition	Yes/no
Is this work experience?	Yes: 90%
Rate a match	Score
Experience vs. job requirements	3.2 / 4
Low match	High match

Illustrative answers. You set the choices and rating scale.²

You define the question and possible answers. The app combines small judgments into a useful workflow; probabilities help flag uncertainty.

On the back, see how the same idea helps organize bookmarks and compare resumes.

When JEV is not a good fit

- Writing replies or code, or explaining itself¹
- Images, audio, or video (text only, for now)¹
- Open-ended questions with no set answers
- Exact rules, math, or lookups (use plain code)
- High-stakes calls with no human review

JEV in practice

Pow Mingle #11 · Two projects using small AI decisions

1. Tidymark

Organizing bookmarks

tidy.tmtt.link

Tidymark gives JEV a page's title, URL, and description, and asks which existing bookmark folder fits best.

It also sorts accumulated bookmarks in batches, flagging uncertain items for review.

Example

“Kyoto cafés” → “Travel / Japan”
Confirm the suggestion and save.

Why it helps: Less time choosing folders, and saved links become easier to find.

2. ResumeDot

Scoring resumes against a job post

resumedot.com

Paste a job post from LinkedIn, drop in resumes, and see who fits the role best.

The app weights JEV's four ratings into one score. Scores shown are illustrative.

Why it helps: It is fast. 100 resumes are scored and ranked in seconds.

I tested it: the same 100 resumes, JEV vs. GPT-4o-mini

■ JEV ■ GPT-4o-mini

Time · seconds for 100 resumes, shorter is better

ATS scoring
4 ratings
JEV: 2.5 s
GPT-4o-mini: 15.7 s · JEV 6.3× faster

Consumer check
3 ratings + evidence
JEV: 2.7 s
GPT-4o-mini: 18.9 s · JEV 7.1× faster

Cost · USD for 100 resumes, shorter is better

ATS scoring
4 ratings
JEV: \$0.005
GPT-4o-mini: \$0.014 · JEV 3.2× cheaper

Consumer check
3 ratings + evidence
JEV: \$0.015
GPT-4o-mini: \$0.043 · JEV 2.9× cheaper

My test, 28 Sep 2026 · synthetic resumes, one run, 400/400 calls succeeded · cost estimated from published rates · speed and cost only, not accuracy.

Made something? Show it off.

Share your project, prototype, or experiment with the group. It can be a work in progress, and it does not have to use JEV. Tell us what you made and what you learned.
